

Fallback

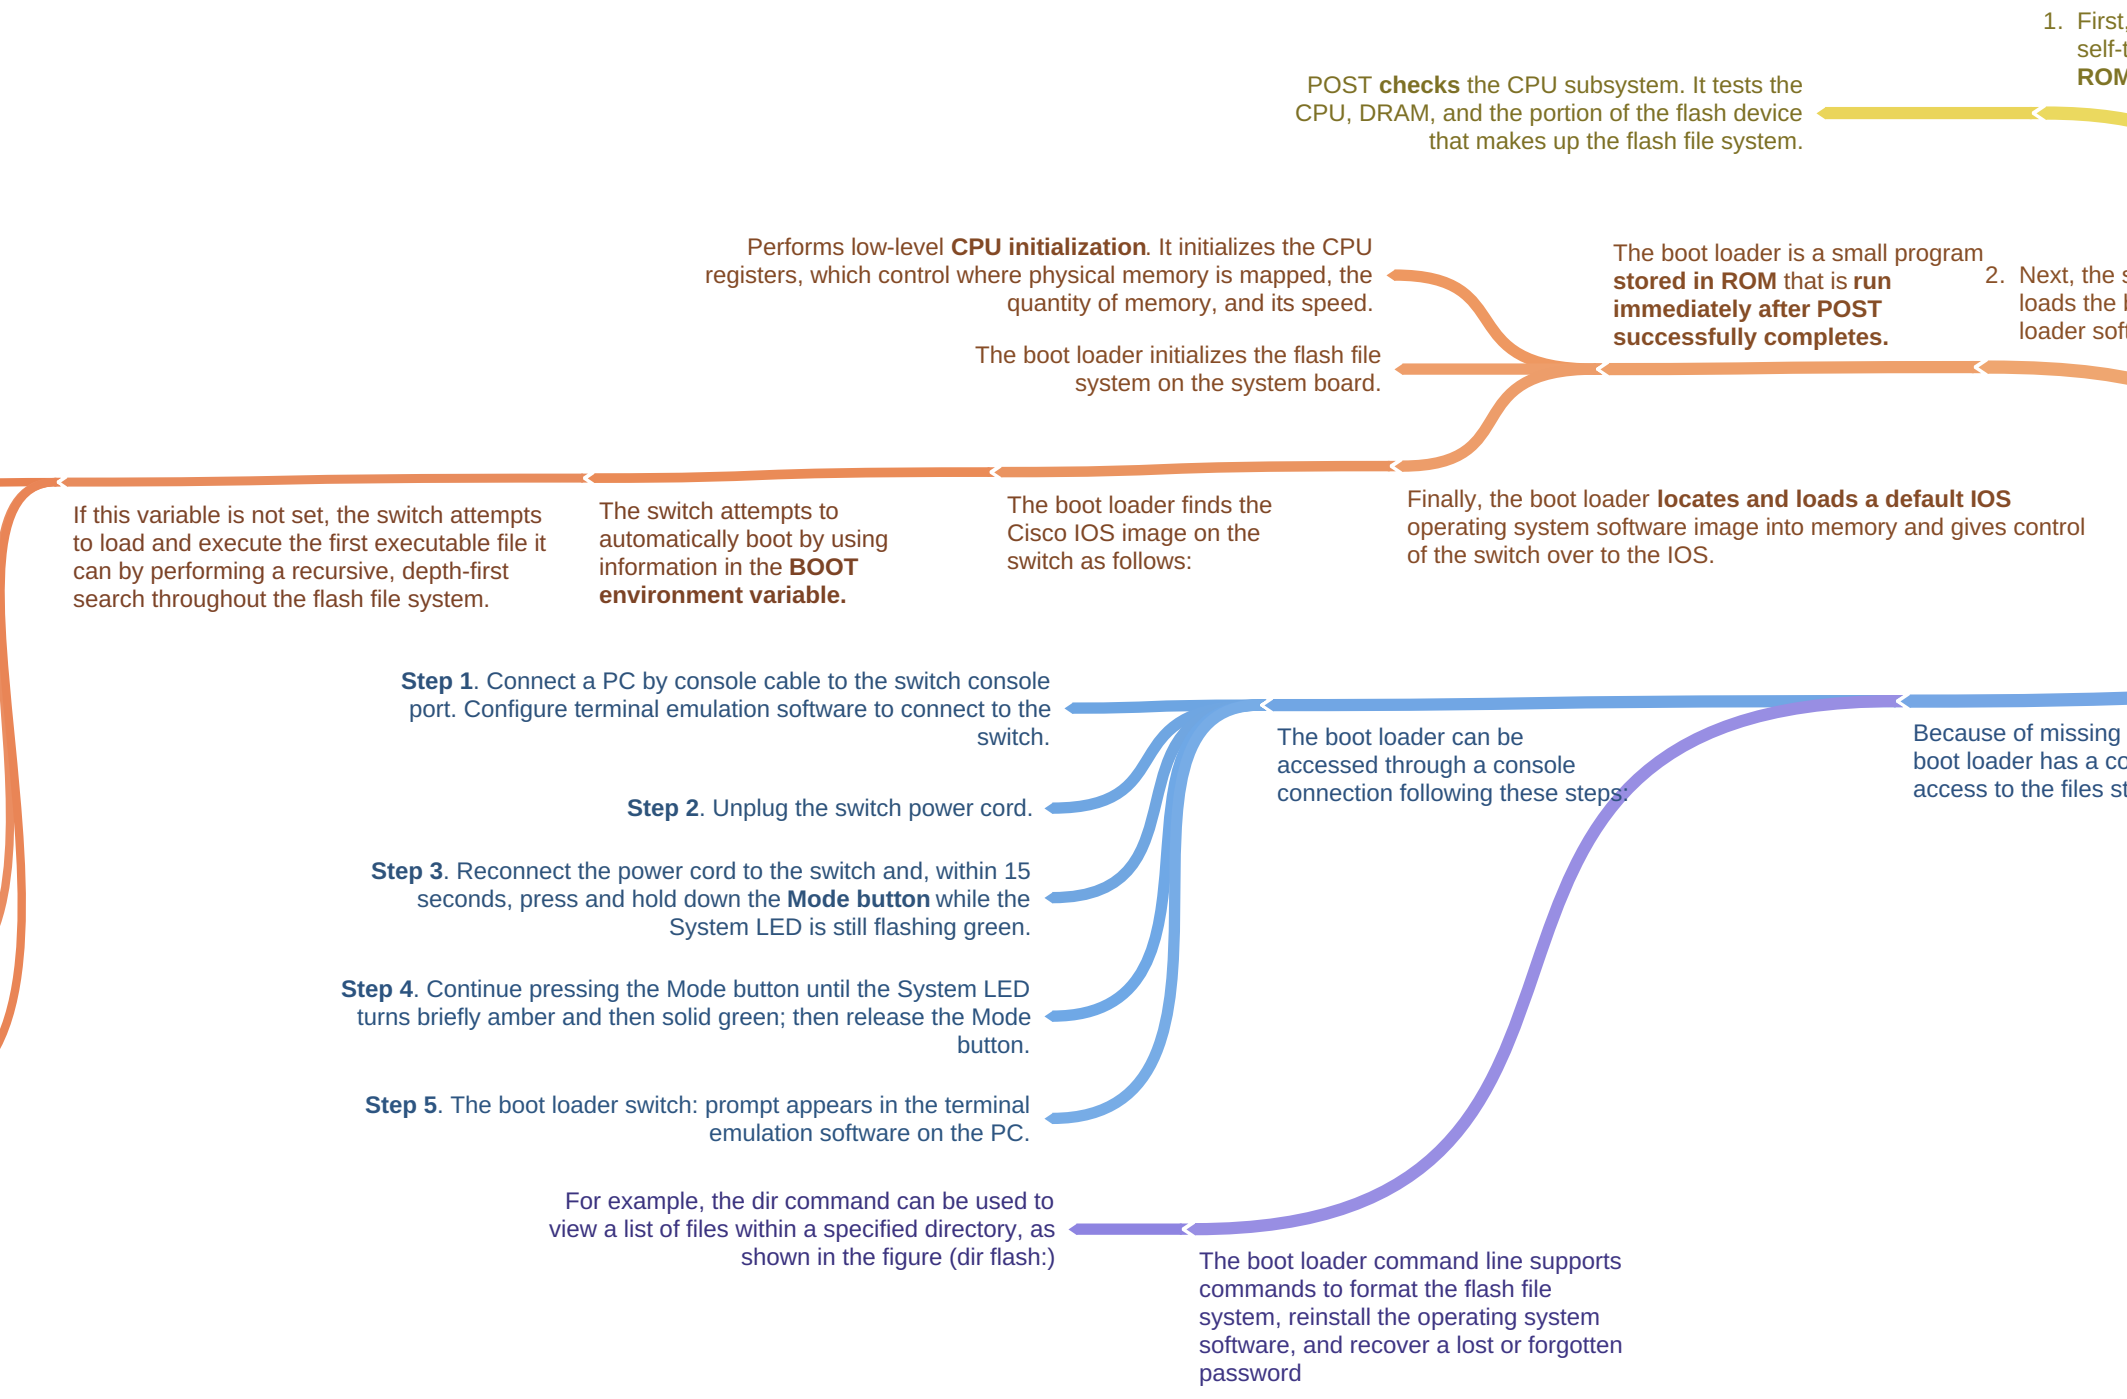

The following commands can be utilized to have a router boot an IOS image from another source:

```
Router# config t
Router(config)# boot system flash ios_filename
Router(config)# boot system tftp ios_filename tftp_address
Router(config)# boot system rom
```

Note: Flash, TFTP server, ROM will be attempted in that order

the BOOT environment variable is set using the boot system global configuration mode command, before the IOS is located in a distinct folder and the folder path is specified.

Use the command show boot to see what the current IOS boot file is set to.
